One of the most deadly and disabling consequences of America's obesity epidemic is the precipitous increase in the number of individuals suffering from diabetes. According to the American Diabetes Association (ADA), approximately 180 million people are diagnosed with and 9.1 million new cases diagnosed in 2005. The ADA predicts that one in three Americans born in 2000 will develop diabetes during their lifetime (ADA 2005). These ever-increasing numbers, coupled with the serious complications and high healthcare costs associated with the disease, have spurred action in improving the prevention and treatment of diabetes. Some grantmakers are at the forefront of efforts to meet the needs of people at risk or with diabetes, and is, therefore, the main focus of most prevention efforts. This increased prevalence of diabetes in recent years has partly driven the increased costs associated with the disease, have spurred action to improve the U.S. health system prevents and treats this disease.

developing and managing population health, developing and implementing evidence-based policies, and fostering an environment that supports population health. The California Endowment (Los Angeles, CA) has released a report that documents the results of its community health assessment and development process. This report details the process of identifying community needs and priorities, developing strategies to address those needs, and implementing those strategies. It also outlines the key stakeholders involved in the process and the impact of the assessment on community health planning.

A recent report from the MacColl Institute for Healthcare Innovation (Chapel Hill, NC) has found that the use of health information technology (HIT) can improve patient outcomes and reduce costs. The report, titled “The Potential of HIT for Improving Health Care Quality and Efficiency,” examined the evidence for the impact of HIT on a range of outcomes, including patient satisfaction, healthcare costs, and clinical outcomes. The report found that HIT can lead to improvements in both quality and efficiency, but more research is needed to fully understand its potential.

The report also found that HIT can improve patient outcomes in a variety of ways, including by improving communication between healthcare providers, increasing the availability of patient information, and facilitating the delivery of evidence-based care. However, the report notes that the benefits of HIT are not realized if it is not used effectively. The report concludes that healthcare organizations need to develop comprehensive strategies for implementing and using HIT in order to achieve the full benefits of this technology.
